

1.Ideation phase

- ✓ **Found the Problem:** Employees don't have a simple, digital way to ask for a new ID card, and tracking requests manually via email is messy.
- ✓ **Came up with the Idea:** Planned a digital request system where an employee can order a card, instantly see their order details (like time and price), and track it online.
- ✓ **Mapped out the Steps** Decided on paper how the order should flow:
Order Submitted → Sent for Approval → Notification Sent → Card Printed.
- ✓ **Set the Goals:** Agreed that the system must give the user immediate feedback (like an order confirmation message) and automatically alert the right teams.
- ✓ **Defined Request Types:** Decided that the system should handle three simple situations: *New Hires*, *Lost/Damaged Cards*, and *Name Changes*.
- ✓ **Planned for Security:** Agreed that only authorized managers should be able to approve a card request before it actually gets printed.
- ✓ **Designed the User Experience:** Decided the interface needs to be clean, simple, and look like a standard online shopping checkout page so anyone can use it without training.
